Trans. of Kislorod (USSR) 1959, v. 12, no. 2, p. 38.

A method of determining the viscosity of compressed gases at low temperatures is described. The gas flows through two capillaries. One of the capillaries is the working one and the gas flows through it at the given pressure and temperature. The other is the comparative capillary, the gas flowing through it at a pressure close to atmospheric pressure and at room temperature. The desired viscosity is proportional to the ratio of the pressure drops in the capillaries. The results of measurements of the viscosity of air and argon are tabulated.
